Ans. (A)

Sol. Given $\mathrm{x}+2 \mathrm{y}+\mathrm{z}=7$
$x+\alpha z=11$
$2 x-3 y+\beta z=\gamma$
Now, $\Delta=\left|\begin{array}{ccc}1 & 2 & 1 \\ 1 & 0 & \alpha \\ 2 & -3 & \beta\end{array}\right|=7 \alpha-2 \beta-3$
$\therefore$ if $\beta=\frac{1}{2}(7 \alpha-3)$
$\Rightarrow \Delta=0$
Now, $\Delta_{x}=\left|\begin{array}{ccc}7 & 2 & 1 \\ 11 & 0 & \alpha \\ \gamma & -3 & \beta\end{array}\right|$
$=21 \alpha-22 \beta+2 \alpha \gamma-33$
$\therefore$ if $\gamma=28$
$\Rightarrow \Delta_{\mathrm{x}}=0$
$\Delta_{y}=\left|\begin{array}{ccc}1 & 7 & 1 \\ 1 & 11 & \alpha \\ 2 & \gamma & \beta\end{array}\right|$
$\Delta_{y}=4 \beta+14 \alpha-\alpha \gamma+\gamma-22$
$\therefore$ if $\gamma=28$
$\Rightarrow \Delta_{\mathrm{y}}=0$
Now, $\Delta_{z}=\left|\begin{array}{ccc}1 & 2 & 7 \\ 1 & 0 & 11 \\ 2 & -3 & \gamma\end{array}\right|=56-2 \gamma$
If $\gamma=28$
$\Rightarrow \Delta_{\mathrm{z}}=0$
$\therefore$ if $\gamma=28$ and $\beta=\frac{1}{2}(7 \alpha-3)$
$\Rightarrow$ system has infinite solution
and if $\gamma \neq 28$
$\Rightarrow$ system has no solution
$\Rightarrow \mathrm{P} \rightarrow$ (3) ; $\mathrm{Q} \rightarrow$ (2)
Now if $\beta \neq \frac{1}{2}(7 \alpha-3)$
$\Rightarrow \Delta \neq 0$
and for $\alpha=1$ clearly
$\mathrm{y}=-2$ is always be the solution
$\therefore$ if $\gamma \neq 28$
System has a unique solution
if $\gamma=28$
$\Rightarrow \mathrm{x}=11, \mathrm{y}=-2$ and $\mathrm{z}=0$ will be one of the solution
$\therefore \mathrm{R} \rightarrow 1 ; \mathrm{S} \rightarrow 4$
$\therefore$ option 'A' is correct

Ans. (B)
Ans. ()
Sol. $L_{1}: \vec{r}_{1}=\lambda(\hat{i}+\hat{j}+\hat{k})$
$L_{2}: \vec{r}_{2}=\hat{\mathrm{j}}-\hat{\mathrm{k}}+\mu(\hat{\mathrm{i}}+\hat{\mathrm{k}})$
Let system of planes are
$a x+b y+c z=0$
$\because$ It contain $\mathrm{L}_{1}$
$\therefore \mathrm{a}+\mathrm{b}+\mathrm{c}=0$
For largest possible distance between plane (1) and $\mathrm{L}_{2}$ the line $\mathrm{L}_{2}$ must be parallel to plane (1)
$\therefore \mathrm{a}+\mathrm{c}=0$
$\Rightarrow \mathrm{b}=0$
$\therefore$ Plane $\mathrm{H}_{0}: \mathrm{x}-\mathrm{z}=0$

Now $\mathrm{d}\left(\mathrm{H}_{0}\right)=\perp$ distance from point $(0,1,-1)$ on $\mathrm{L}_{2}$ to plane.
$\Rightarrow \mathrm{d}\left(\mathrm{H}_{0}\right)=\left|\frac{0+1}{\sqrt{2}}\right|=\frac{1}{\sqrt{2}}$
$\therefore \mathrm{P} \rightarrow 5$
for 'Q' distance $=\left|\frac{2}{\sqrt{2}}\right|=\sqrt{2}$
$\therefore \mathrm{Q} \rightarrow 4$
$\therefore(0,0,0)$ lies on plane
$\therefore \mathrm{R} \rightarrow 3$
for ' $\mathrm{S}^{\prime} \mathrm{x}=\mathrm{z} ; \mathrm{y}=\mathrm{z} ; \mathrm{x}=1$
$\therefore$ point of intersection $\mathrm{p}(1,1,1)$.
$\therefore \mathrm{OP}=\sqrt{1+1+1}=\sqrt{3}$
$\therefore \mathrm{S} \rightarrow 2$
$\therefore$ option [B] is correct
17. Let $z$ be complex number satisfying $|z|^{3}+2 z^{2}+4 \bar{z}-8=0$, where $\bar{z}$ denotes the complex conjugate of $z$. Let the imaginary part of $z$ be nonzero.

(P) $|z|^{2}$ is equal to
(Q) $|z-\bar{z}|^{2}$ is equal to
(R) $|z|^{2}+|z+\bar{z}|^{2}$ is equal to
(S) $|\mathrm{z}+1|^{2}$ is equal to
(4) 10
(5) 7

The correct option is :
(A) (P) $\rightarrow(1)(\mathrm{Q}) \rightarrow(3)(\mathrm{R}) \rightarrow(5)(\mathrm{S}) \rightarrow(4)$
$(\mathrm{B})(\mathrm{P}) \rightarrow(2)(\mathrm{Q}) \rightarrow(1)(\mathrm{R}) \rightarrow(3)(\mathrm{S}) \rightarrow(5)$

$(\mathrm{D})(\mathrm{P}) \rightarrow(2)(\mathrm{Q}) \rightarrow(3)(\mathrm{R}) \rightarrow(5)(\mathrm{S}) \rightarrow(4)$

## Ans. (B)

Sol. $\because|z|^{3}+2 z^{2}+4 \bar{z}-8=0$
Take conjugate both sides
$\Rightarrow|z|^{3}+2 \bar{z}^{2}+4 z-8=0$
By (1) - (2)
$\Rightarrow 2\left(\mathrm{z}^{2}-\overline{\mathrm{z}}^{2}\right)+4(\overline{\mathrm{z}}-\mathrm{z})=0$
$\Rightarrow \mathrm{z}+\overline{\mathrm{z}}=2$
$\Rightarrow|z+\bar{z}|=2$
Let $\mathrm{z}=\mathrm{x}+\mathrm{iy}$
$\therefore \mathrm{x}=1$
$\therefore \mathrm{z}=1+\mathrm{iy}$

Put in (1)
$\Rightarrow\left(1+y^{2}\right)^{3 / 2}+2\left(1-y^{2}+2 \mathrm{iy}\right)+4(1-\mathrm{iy})-8=0$
$\Rightarrow\left(1+y^{2}\right)^{3 / 2}=2\left(1+y^{2}\right)$
$\Rightarrow \sqrt{1+\mathrm{y}^{2}}=2=|\mathrm{z}|$
Also $y= \pm \sqrt{3}$
$\therefore \mathrm{z}=1 \pm \mathrm{i} \sqrt{3}$
$\Rightarrow \mathrm{z}-\overline{\mathrm{z}}= \pm 2 \mathrm{i} \sqrt{3}$
$\Rightarrow|z-\bar{z}|=2 \sqrt{3}$
$\Rightarrow|\mathrm{z}-\overline{\mathrm{z}}|^{2}=12$
Now $z+1=2+i \sqrt{3}$
$|z+1|^{2}=4+3=7$
$\therefore \mathrm{P} \rightarrow 2 ; \mathrm{Q} \rightarrow 1 ; \mathrm{R} \rightarrow 3 ; \mathrm{S} \rightarrow 5$
$\therefore$ Option [B] is correct.
